Contents of this report have been approved by the World Agricultural Outlook Board, and the summary was released June 17, 1986. Materials may be reprinted without permission. *Agricultural Outlook* is published monthly, except for the January/February combined issue. Price and quantity forecasts for crops are based on the June 10 World Agriculture Supply and Demand Estimates.

Annual subscriptions: \$26 U.S., \$32.50 foreign. Order from ERS Publications, 1301 New York Ave., NW, Room 228, Washington, D.C. 20005-4789. Make check payable to ERS Publications. You will receive a copy of the current issue and acknowledgement of your subscription order. For further information, call (202) 786-1494. Subscriptions also available from the Government Printing Office; for information, call the GPO order desk at (202) 783-3238.

The next issue of *Agricultural Outlook* (AO-122) is scheduled for mailing on August 1, 1986. If you do not receive AO-122 by August 15, call the Managing Editor (be sure to have your mailing label handy). The full text and tables of AO-122 will also be available electronically. For more information, write EMS/USDA, 1301 New York Avenue, N.W., Room 228, Washington, D.C. 20005-4789, or call (202) 786-1494.

In Brief. . .

News of Farm Labor, Exports by Region, Produce Shipping

The number of U.S. farm operators and unpaid family workers declined about 5.5 percent during the year ending in April 1986, continuing the long-term drop in farm employment. Farm family employment declined more than hired employment, as hired workers were substituted for family workers.

Growing conditions from planting through early growth were good this year for major U.S. field crops in most regions. With a few exceptions, crop progress through late May was ahead of normal. Unusually wet conditions in the upper Corn Belt and Dakotas slowed planting and threatened crop development there. But, improved weather in these areas during late May and early June allowed farmers to complete most plantings and crops to grow.

In the Southeast, below-normal soil moisture just before and during planting dominated crop development this spring. However, dry weather through early June in the South Atlantic Coast States received more attention, as winter wheat matured and spring crops emerged and began to grow. Bad conditions in these regions, though, were offset by very favorable soil moisture in most of the Midwest and Plains through early June.

Reduced acreage and less-than-favorable weather have cut winter wheat production prospects. A smaller winter wheat harvest may bring total 1986 wheat output to about 2.2 billion bushels, compared with last season's 2.4 billion. But, the new crop plus the record carryover will still put 1986/87 wheat supplies at a record 4.03 billion bushels.

U.S. feed grain production is expected to fall about 15 percent in 1986/87, to 235 million metric tons, while exports and domestic use together may rise 6 percent to 217 million. Nevertheless, feed grain ending stocks will probably mount to nearly four times what they were at the end of 1983/84. This means grain and soybean storage could be tight during harvest.

Palm oil has emerged as a major competitor in world vegetable oil markets during the past decade. Malaysia is the main producer, and since its domestic use is negligible, most output is exported. Palm oil's low production costs make it a strong competitor for soybean oil, and Malaysia has the additional advantage of proximity to its palm markets.

U.S. vegetable growers are reducing 1986 acreage and hoping for improved second-half prices. Based on winter and spring-season estimates of fresh-market harvest area and processors' contract intentions, 1986 acreage could be down 4 percent from 1985. This is a response to low fresh-market prices during spring 1985 and winter 1986.

Hog prices averaged \$47 per cwt at the 7 markets in May, up \$7 from April. The price rally was due to declining slaughter rates, sharply lower year-over-year frozen pork stocks, and smaller imports of pork products and live hogs.

Further processing of broilers is increasing because processors can convert low-valued parts into higher priced products such as patties and nuggets. Producer-processors also have a strong market for chicken breast meat; breast prices are now almost double the price of whole birds. This trend reflects the addition of many new processed breast meat entrees, especially in fast food restaurants.

Transportation should be readily available for this summer's fresh fruit and vegetables. Trucks will remain in good supply and account for over 86 percent of all overland fruit/vegetable shipments. Trucks offer produce marketers faster service and more direct routes than competing modes.

U.S. agricultural exports during fiscal 1986 are now forecast at \$27.5 billion, 12 percent below 1985. While lower prices for major commodities account for some of the decline, expected drops in grain and cotton shipments are more important. Export volume during 1986 is forecast at 115.5 million tons, about 10 million below 1985.

Spain and Portugal became members of the EC this year. Their transition to the EC's Common Agricultural Policy began on March 1. U.S. agricultural exports to the two countries may decline because of the adoption of CAP provisions.

The Soviet Union recently announced policy and organizational changes aimed at improving farm productivity and reducing reliance on imports. Even a modest increase in Soviet grain production could trim the USSR's grain import needs substantially. If Soviet grain output reaches 220 million metric tons by 1990, and per capita meat consumption remains at 65 kilograms a year, grain import needs could drop by nearly 65 percent. However, imports could remain high even with better domestic output if the state decides to raise per capita meat consumption.

Agricultural Economy

The number of U.S. farm operators and unpaid family workers declined about 5.5 percent during the year ending in April 1986, continuing the long-term drop in farm employment. Between 1950 and 1985, annual average employment tumbled from about 10 million people to slightly under 3 million.

Also, farm family employment (operator and unpaid workers) declined more than hired employment, as hired workers were substituted for family workers. In 1950, hired workers comprised about 23 percent of total farm employment. By 1985, the proportion had increased to 35 percent.

Family Workers Still Declining

The rate of decline in farm employment was much greater in the 1950's and 1960's than it has been since. In fact, the number of hired workers stabilized in the 1970's.

But, farm family employment continues to drop. Between 1974 and 1981, family employment declined about 4 percent per year, but there was not a significant change in the number of hired workers employed. Incomplete data since 1981 suggest trends similar to those from 1974 to 1981. Hours worked by hired workers since 1981 may have declined slightly from 1974-81.

The ratio of hired workers to family workers varies widely among States.

In 1985, for example, hired employment comprised about 75 percent of total farm employment in California and Florida, but averaged only 22 percent for the Corn Belt. Variation comes from differences in types of agriculture and sizes of farms.

Average per-farm expenditures for hired labor on fruit and vegetable farms was about \$40,000 in 1982. Fruit and vegetable farms are predominantly in California and Florida. In contrast, the average labor expenditures per cash grain and livestock farm — typical of the Corn Belt — were only \$4,000 to \$6,000.

Large Farms Raise Labor Needs

Labor requirements in agriculture have decreased over the long term. Productivity per worker has increased because of mechanization and improvements in other farm production technologies, such as higher yielding crops. Also, less family labor is needed today because there are fewer farms.

However, the amount of hired labor used on some farms has climbed as family labor has declined, and increases in average farm size have raised the need for hired labor. Farm

expenditures for hired and contract labor, adjusted for inflation, increased only 2 percent between 1974 and 1982. Yet there was a substantial increase in labor expenditures on farms with annual sales of \$500,000 and more. These farms made about 37 percent of the total labor expenditures on all farms in 1974, and nearly 47 percent in 1982.

Recent farm financial problems apparently have had little impact on farm employment. Since 1981, the greatest percentage declines in farm employment have occurred in the Northeast, Appalachia, the Southeast, and Florida. However, land values in those States either appreciated between 1981 and 1986 or fell less than the 27-percent national average. The percentage decline in farm employment in the rest of the country since 1981 has been less than half the average decline in the East Coast and Appalachia, yet land values in the Midwest, Lake States, and Mountain States have fallen as much as three times the national average.

The factors which have determined long-term trends in farm employment appear to be also shaping current employment. The mechanization of farm

\$100,000 to \$499,999	34.3	35.8	34.8
\$500,000 and more	37.2	41.1	46.7
Total	100.0	100.0	100.0

*Calculations for 1974 and 1978 are based on data adjusted to 1982 dollars.

production progressed rapidly in the 1950's and 1960's, causing large declines in labor requirements. Since then, mechanization has slowed considerably. However, mechanization has not occurred evenly across commodity groups.

The mechanization of fruit and vegetable harvesting is far from complete, and much seasonal labor is still re-

quired in production. The demand for labor-intensive commodities, including fresh fruits and vegetables, and the speed at which the harvest of these crops is mechanized will have important effects on future employment in agriculture. [Robert Coltrane (202) 786-1932 and Terry Townsend (202) 786-3313]

LIVESTOCK HIGHLIGHTS

Cattle

In late May, USDA released figures showing when farmers in the Dairy Termination Program (DTP) will slaughter their herds. As expected, 67 percent of the cows in the program are to be slaughtered in the first period — April through August. Nearly half (287,000) of the first period's cows were probably slaughtered by the end of May.

Slaughter of DTP heifers and calves is following a similar pattern. Slaughter should rise again in July-August as the first period closes. August slaughter is expected to be about 70 percent of the high April level. However, on June 13, USDA announced that producers holding contracts for disposal of 157,000 cattle during the first period have requested a later disposal period.

The slaughter rate will be lower for the rest of the program, with a slight increase in August 1987, the last month of the DTP. Nonparticipating dairy farmers will probably attempt to cull before or somewhat after August 1986. Through June 9, USDA purchased 183.9 million pounds of beef under the DTP, worth \$142.6 million.

Continued heavy fed cattle slaughter weights and the likelihood of faster marketings of cattle placed on feed in early spring should boost third-quarter beef production. Many of these cattle were placed on feed at heavier-than-normal weights and in fleshier condition, which means more will be marketed in early to midsummer. Non-fed steer and heifer slaughter also remains large, despite expected lower grain prices and reduced feeder cattle inventories. Drought and poor forage in the Southeast through early June likely forced more cattle from this area on the market.

Choice fed steer prices at Omaha averaged over \$56 in May, up from the April low of \$52; however, large meat supplies forced prices to the low \$50's in mid-June, and price strength is unlikely until beef supplies decline. Prices in the \$60's are unlikely until fall.

Utility cow prices have rebounded, averaging in the upper \$30's since late April, mainly because of large USDA purchases of cow beef. Yearling feeder cattle prices remain under pressure because of low fed cattle prices and continued strong grain prices, in turn due

to tight free stocks. Larger cattle marketings in the Southeast are also holding down price gains for feeder cattle. (R. A. Gustafson (202) 786-1830)

Hogs

Hog prices averaged \$47 per cwt at the 7 markets in May, up \$7 from April. The price rally was due to declining slaughter rates, sharply lower year-over-year frozen pork stocks, and smaller imports of pork products and live hogs. Barrow and gilt weights averaged 244 pounds, compared with 247 a year earlier. The declining weights and high second-quarter slaughter (compared with the March 1 inventory of market hogs weighing 60 to 179 pounds) indicate that marketings are current.

Preliminary data for the second quarter indicate that commercial slaughter was down about 3 percent from a year earlier. Most second-quarter slaughter comes from the March 1 market-hog inventory weighing 60 to 179 pounds. This inventory was down 4 percent from a year earlier. The ratio of slaughter to inventory is the largest since records began in 1973.

Pork stocks in cold storage on April 30 totaled 286 million pounds, down 22 percent from last year. All categories were down, with hams showing the largest decline, 42 percent. Belly stocks were down 18 percent. The reduced stocks, along with seasonal production declines, will further tighten supplies this summer, when prices are normally at their high.

Currently, farrow-to-finish production costs in the Corn Belt are about \$44 per cwt. Because of low production costs and higher hog prices, producers' returns are the greatest in over 3 years. Despite higher returns, recent slaughter data suggest no major build-up of hog numbers.

However, with sustained profits and low feed costs, producers will have an incentive to expand later this year. In addition, some participants in the Dairy Termination Program may convert their facilities to hog production. (Leland Southard (202) 786-1830)

Broilers

Second-half 1986 broiler meat output from federally inspected plants may be

5 percent above 1985's 6,827 million pounds. This would imply third-quarter production at the same high level as second quarter. This output may be near the present capacity of the industry, especially of its grow-out facilities. The fact that the industry has not sharply expanded, despite very favorable returns, suggests some physical limits to expansion potential.

Second-half prices for whole branded birds, Grade A without giblets, may average 48 to 54 cents per pound, near last year's 51 cents. Prices could average in the upper end of the range if domestic tourism increases. The reason is that fast food restaurants have higher sales during the summer travel period, and with more people staying in the United States for vacations, sales may climb more than usual. Chicken items now appear on most fast food menus.

Estimated net returns for whole birds averaged over 6 cents per pound in second-half 1985. Grain prices will likely be below 1985 through the remainder of 1986, putting the cost of broiler production at or below last year. If prices turn out as expected, net returns during second-half 1986 will remain favorable for producers. [Allen Baker (202) 786-1830]

Turkeys

Second-half output of turkey meat is expected to be up sharply from 1985. Strong demand for processed turkey products has resulted in favorable net returns and encouraged expanded production. Federally inspected output in the second half may be 14 percent above 1985's 1,689 million pounds.

Cold storage stocks continued above 1985 throughout May. After 2 years of tight supplies in the fourth quarter, stocks will probably be larger than last year but have little influence on prices.

Prices were strong in the second quarter, despite increased production. Whole-bird prices were supported by demand for storage stocks and by increased processing. Prices for 8- to 16-pound hen turkeys in the Eastern Region may average 68 to 72 cents per pound during the third quarter, down from 78 cents in 1985. During the fourth quarter, young hen turkeys may average 77 to 83 cents, compared with 90 cents last year.

Net returns to turkey producers are likely to remain favorable in 1986. Estimated wholesale costs during second-quarter 1985 averaged 60 cents per pound. With grain prices expected to decline through the end of the year, costs are likely to be lower than in 1985, resulting in returns above costs. [Allen Baker (202) 786-1830]

Eggs

Egg production is expected to increase from last year in the third and fourth quarters. Producers have ordered more pullets to enter the flocks in the third quarter. In addition, the number of older hens may not be reduced enough to offset the extra pullets. One indication is that producers are force-molting old hens. When rested, these hens are usually kept in lay.

Even though hen numbers will be up, egg production may be up far less from last year because of a decline in the rate of lay. In 1985, producers were cutting back and selling their least productive hens. Since the remaining hens were more productive, the rate of lay increased by 2 eggs per layer.

Egg prices may slip below a year earlier by the fourth quarter. Third-quarter prices for cartoned Grade A large eggs in New York may average 66 to 70 cents per dozen, near 1985's 68 cents. Demand increases late in the third quarter when schools reopen. Also, the strong yen has lowered U.S. prices to Japan and helped increase U.S. egg-product exports. Exports will likely continue higher during the fourth quarter and help strengthen prices. At 67 to 73 cents per dozen, however, prices will be down from 1985's 76 cents.

Net returns to producers who sell at wholesale are expected to remain favorable because grain prices are forecast lower. In second-half 1985, wholesale costs were estimated at 65 to 66 cents per dozen. If grain prices fall, costs should remain the same or decline slightly. Net returns for second-half 1986 will be positive if price forecasts hold true. However, returns in the third quarter may only be near break-even, especially early in the quarter. [Allen Baker (202) 786-1830]

Dairy

Except for second-half 1984, milk prices since 1980 have been held below support levels by heavy surpluses. This situation will change this summer and fall, as the herd buyout program bites deeply into the surplus. Even so,

Heavy Milk Surpluses Flatten Price Rises

*Milk equivalent (fat basis), net of domestic sales for unrestricted use.

the average effective price in 1986 will be the lowest since 1979, because of support-program deductions and low prices during the first half of the year.

Wholesale prices of dairy products probably will rise this summer. The timing and magnitude of the increases will be greatly affected by when buyout participants leave dairying, the size of the production expansion by remaining producers, early-summer commercial stocks, and the strength of commercial use.

Wholesale price increases probably will be reflected fairly quickly in farm prices. In addition, competitive pressures may shrink manufacturing margins slightly. By this fall, the Minnesota-Wisconsin (M-W) price of manufacturing-grade milk will be above a year earlier and could average 55 cents to \$1 above the spring low. The M-W price in turn determines most milk prices in the country.

During the first 5 months of 1986, prices of all milk averaged \$12.20 per cwt, down more than \$1 from a year earlier. For 1986 as a whole, the decline in the all-milk price probably will be 10-40 cents. The effective milk price will be down 35-65 cents because of this year's larger average deductions. [James Miller (202) 786-1830]

CROP HIGHLIGHTS

Wheat

Reduced acreage and less-than-favorable weather have cut winter wheat production prospects. As of June 10, the 1986 U.S. winter wheat harvest is forecast at 1.58 billion bushels, 14 percent under 1985 and an 8-year low. Program participation helped reduce prospective winter-wheat harvested area about 5 million acres from last season.

Heavy program participation by growers of spring wheat (Durum, Hard Red Spring, and White) and delayed seeding resulting from a cool, wet spring may put 1986's harvest lower than 1985's near-600-million-bushel crop. In total, 1986 U.S. wheat production may approach 2.15 billion bushels. Adding lower new-crop supplies to the record carryover boosts 1986/87 wheat supplies to a record 4.03 billion bushels.

The 1986/87 supply and demand prospects suggest farm prices near the loan rate. Heavy use of loans by program participants may result in tight free market supplies for one or more wheat classes. Nevertheless, the average farm price is forecast to be \$2.25 to \$2.50 a bushel, compared with \$3.16 in 1985/86.

Lower wheat prices and various export promotion programs are expanding U.S. export sales in 1986/87, and may add about 200 million bushels to last year's low volume of 910 million.

New-crop sales as of June 1 are already more than 30 percent ahead of last year. Sales are up to North Africa (Algeria and Egypt), the Middle East (Iraq and Israel), and to many Latin American nations, while they are considerably behind last year's pace to Brazil and Indonesia. The Export Enhancement Program has successfully stimulated U.S. wheat exports to North Africa and the Middle East. More than 5 million tons of wheat and flour were sold through the program between September 1985 and June 1986.

Lower domestic prices should also encourage increased use for livestock feed early in the season and maintain growth in wheat food use.

The June forecast for 1986/87 world wheat production is 504 million tons, up 2 million from last year. Good

Overview of Crop Conditions

Growing conditions from planting through early vegetative development were good this year for major U.S. field crops in most producing regions, except in the Southeast and Southern Plains. With a few exceptions, crop progress through late May was ahead of normal.

Unusually wet conditions in the upper Corn Belt and Dakotas slowed planting, while very dry conditions in the Southeast and Southern Plains also slowed planting and threatened crop development. But, improved weather in these areas during late May and early June allowed farmers to complete most plantings and crops to develop.

In the Southeast, below-normal soil moisture just before and during planting dominated crop development this spring. However, dry weather through early June in the South Atlantic Coast States received more attention, as winter wheat matured and spring crops emerged and began to develop. Bad conditions in these regions, however, were offset by very favorable soil moisture in most of the Midwest and Plains through early June.

How will the dry weather in the Southeast and South Atlantic Coast States affect U.S. crop production in 1986? The share of annual average 1984-85 U.S. crop production in the Southeast States (Alabama, Florida, Georgia, North Carolina, South Carolina, and Tennessee) most affected by the early-season drought totaled 4.5 percent for corn, 8.7 for cotton, 2.2 for grain sorghum, 9.6 for soybeans (excluding Florida and Tennessee), and 5 for winter wheat (excluding Tennessee).

Likewise, the share of 1984-85 average annual corn, soybean, and winter wheat production grown in the South

weather in many major wheat-producing regions of the Northern Hemisphere points to another year of bountiful supplies, higher stocks, and lower prices.

Atlantic Coast States (Delaware, Maryland, and Virginia) totaled only 1 to 2 percent.

USDA estimates as of June 10 for this season's winter wheat crop show that per-acre yields in the Southeast States are expected to be 9 to 39 percent below average yields during the past 5 years. Per-acre wheat yields in the South Atlantic Coast States in general will be higher than in recent years, however.

For field crops planted during the spring, initial NASS production estimates will not be available until early August. Although it was extremely dry in the Southeast through most of the planting period and remained so through early June in the South Atlantic Coast region, crop production ultimately will depend on weather conditions during the rest of the growing season.

Analysis of 1950-1984 precipitation levels during January-May and June-August in the Southeast shows that the amount of rain received during the first 5 months of the year is not strongly correlated to the amount received later. Consequently, it is difficult to estimate crop production at this stage of the growing season.

Given the relatively small share of total U.S. field crop production in the Southeast and South Atlantic Coast States, favorable growing conditions elsewhere, and large beginning stocks, the early-season dry weather in the Southeast and South Atlantic Coast should not significantly affect aggregate U.S. crop production this season. However, if Southeastern crop production does drop, the effects could be quite dramatic for both farmers and feed purchasers in the region. (Michael Hawthorn (202) 786-1841)

Foreign production is forecast to reach a record 446 million tons, and estimated record crops have already been harvested in South Asia. Dry weather in China has reduced the output fore-

cast by 1 million tons to 87.5 million. Also, dry weather in the Ukraine and the Volga Valley has reduced expected Soviet output to 77 million tons, down 6 million from last year. [Allen Schienbein (202) 786-1841 and Scott Reynolds (202) 786-1691]

Rice

Assuming 1986 planted acreage is close to the March intentions of 2.27 million acres and yields are on trend, U.S. rice production may be about 130 million cwt in 1986/87. Carryin stocks of close to 88 million cwt and imports of 2 million, however, likely will boost supply to a record 220 million cwt. Thus, a projected 17-million-cwt rise in supply may nearly offset the substantial 20-million-cwt increase in exports forecast for 1986/87.

Carryout stocks for 1986/87 are expected to remain large, but for the first time since 1983/84 (the year of PIK), they may be lower than carryin. Over the past few years, long grain stocks have accumulated because production has consistently exceeded total use by nearly 20 million cwt. In 1986/87, long grain production and use may be nearly in balance, while medium and short grain production could again fall short of use.

World milled rice production in 1985/86 is estimated at 316 million tons (464 million, rough basis), down 3 million from last year. The 7-million-ton drop in China's production overshadowed gains in Bangladesh, India, Indonesia, and Thailand. Despite the drop in China's output, world production is expected to exceed utilization by about 2 million tons.

World trade in 1986 is forecast to reach 11.8 million tons, up more than 300,000 from last year. Exports by three major U.S. competitors — Thailand, Pakistan, and Burma — were exceptionally large during the first 4 months of 1986. While Thailand's exports during January-April increased 7 percent over 1985, those of Pakistan and Burma were more than triple 1985 levels. Shipments of more than 250,000 tons each to Brazil and Vietnam contributed to the marked improvement in export volume, particularly for Thailand and Burma.

The United States, on the other hand, experienced a drop in exports in early 1986, as many customers anticipated lower prices after the April 15 beginning of the marketing loan program.

U.S. exports are expected to increase during second-half 1986 and are forecast to reach 2.2 million tons, about 19 percent of world trade.

The national weighted average market price for the first 5 months of the 1985/86 marketing year (August-December) was \$7.73 per cwt, or about 97 percent of the \$8 loan rate. Farmers who participated in the 1985 rice program received deficiency payments of \$3.90 per cwt, the maximum allowed. For the season, farm prices are forecast to average near \$6.50. Between April 18 and May 27, repayment rates for long grain farm-stored loans have averaged \$3.81 per cwt, \$5.05 below the average long grain loan rate of \$8.86. Medium and short grain repayment rates have averaged \$3.30 per cwt, \$3.30 below the average loan rate of \$6.60. [Janet Livezey (202) 786-1841 and Scott Reynolds (202) 786-1691]

Feed Grains

U.S. feed grain production is expected to fall about 15 percent in 1986/87 to 235 million metric tons, while exports plus domestic use may rise 6 percent to 218 million. Nevertheless, ending stocks will probably rise to nearly four times what they were at the end of 1983/84. As a result, farm prices for corn are forecast to average close to the loan rate of \$1.92, although harvest-time prices could be lower.

The estimated 40-million-metric-ton drop in U.S. production this year results from increased participation in the Government feed grain program and an expected drop in yields from last year's record. Corn yields averaged 118 bushels per acre in 1985/86 — above the long-run trend. Estimates of both acreage and yield will be adjusted as the year progresses. The June Acreage Survey will be released in mid-July, while the first production estimates based on survey results will be completed in early August.

Record foreign coarse grain production in 1986/87, coupled with abundant supplies of some non-coarse grain feeds and limited growth of animal numbers, will lead to only a modest increase in world demand for imported feed grains. World imports are expected to total only 90.2 million tons in 1986/87. The forecast increase of 6 million tons

in global trade (excluding intra-EC trade) represents growth of only 7 percent from 1985/86.

As prices fall in September for the 1986 crop, U.S. sales should increase substantially, but they are forecast to remain well below peak levels. U.S. exports are forecast at nearly 49 million tons, compared with 39 million in 1985 and almost 56 million in 1984.

Foreign coarse grain production in 1986/87 is forecast at almost 580 million metric tons, up about 11 million or 2 percent from a year earlier. Although lower production is projected for some foreign export competitors (notably Canada, Australia, and Argentina), major production gains are forecast for both the Soviet Union (up 2 million tons to 96 million) and China (up over 10 million to 94 million). Neither is a record, although China's prospects are only about 1 million tons below the record outturn of 1984/85.

Increased production and abundant beginning stocks, coupled with pent-up demand from purchasing delays this spring and summer, will likely cause 1986/87 foreign utilization to soar to a record of almost 630 million tons, up over 4 percent from a year ago. World consumption could approach 800 million tons, an increase of over 25 million from 1985/86. In spite of the increase, supplies will continue to exceed use, resulting in a boost in ending stocks of about 17 million tons. This, however, is significantly lower than the increase in 1985/86. [David Hull (202) 786-1840 and James Cole (202) 786-1691]

Oilseeds

Soybean prices (No. 1 yellow, Central Illinois) averaged \$5.23 a bushel in April and near \$5.25 in May. This recent stability is probably attributable to the soybean loan program. As of June 11, 513.4 million bushels from the 1985 crop had been placed under loan. However, because of redemptions loans outstanding dropped to 384.7 million, after peaking at 459.4 million the week of February 12. Redemptions totaled 128.5 million bushels by June 11, and CCC acquisitions of 1985-crop soybeans remain a scant 200,000 bushels.

Because world vegetable oils are in chronic oversupply, the U.S. soybean

Storage Likely Tight This Fall

The 1985/86 crop year will likely have record carryout for several major grains. Corn carryout could reach 4 billion bushels (September 1), more than double 1984/85. Wheat carryout likely was 1.9 billion bushels (June 1), up more than 30 percent from a year earlier. These large stocks could lead to tightness in storage this fall when corn and soybeans are harvested.

It is difficult to know exact storage requirements because new-crop supplies become available over the entire harvest period, and some disappearance takes place as grain is exported, fed, and milled over the same period. For this reason, total supply (carryin plus production plus imports) for the fall quarter overstates actual storage needs. However, the fall supply of major grains can be useful as a relative measure over time of storage requirements.

The accompanying table compares expected 1986 total supply (October 1 basis for grains, September 1 basis for soybeans) with recent critical years. Both 1982 and 1985 had record-breaking supplies. The total supply of feed grains, wheat, and soybeans was 18 billion bushels in 1982, while storage capacity was estimated to be about 18.9 billion bushels. The supply of these commodities was slightly larger in 1985, 18.2 billion bushels. A new NASS survey in 27 States indicates that about 16 percent more on-farm storage capacity is now available than was estimated for 1982. Previous estimates were based on a comprehensive 1978 survey of on-farm storage capacity updated with capacity built through the Farm Storage Facility Loan Program.

Thus, with off-farm storage capacity estimated at about 8.2 billion bushels, total 1985 and 1986 capacity could be near 21.8 billion. With an estimated 19.3-billion-bushel grain and soybean supply in fall 1986, storage capacity is likely to be stretched, but not as badly as in 1982. There will be about 2.5 billion bushels of excess capacity this year, compared with 0.9 billion in 1982.

Storage space may be tight even though total capacity exceeds grain supplies. Elevator operators need a certain amount of working space within each elevator to separate and gain access to particular lots of grain. As grain and soybean supplies rise in relation to storage capacity, the likelihood of localized storage shortages increases.

Why Is Storage Capacity Of Concern?

Grain may temporarily be stored in rail cars, barges, and even on the ground. In fact, some ground storage of grain occurs in most years, but it is difficult to maintain quality for long since insects, other pests, and mold may cause damage. Grain should be stored at or below recommended moisture levels, in a sanitary environment, and with proper fumigation and aeration.

Large quantities of grain are owned by the Government, or under various regular, reserve, and special loan programs. These inventories are usually required to be stored in approved facilities to protect them from damage. Although emergency storage programs were in effect in 1985, under which temporary storage measures were approved, this type of storage is not desirable because there is a greater chance of the grain going out of condition. On the other hand, quonset huts and other machinery sheds can be converted to grain storage fairly easily and effectively. Thus, precise measurement of storage capacity is difficult.

To ease expected problems in 1986, federally licensed grain warehousemen will be permitted to transfer stored grain to other warehouses. With written permission from the owner, and after notifying ASCS in writing, warehousemen may even transfer grain that is Government-owned or under CCC loan.

Should More Storage Be Built?

From the individual farmer's or merchandiser's viewpoint, the decision to build more storage must take local conditions and longer term prospects into account. The cost of storage facility construction must be weighed against the risk of losing revenues because of

forced selling and quality deterioration without adequate storage space.

From a national viewpoint, the decision to add storage of these commodities must be made in the context of national agricultural and trade policy goals. Over half of the world's wheat, coarse grain, and soybean stocks are held in the United States. All this storage activity is costly.

For example, the average cost of storage charged to the Commodity Credit Corporation by county elevators is about 33 cents per year for one bushel of wheat. The United States has recently been faced with declining world prices and trade in wheat and coarse grains and strong competition in soybeans, leading to a rise in ending stocks. But an alternative to storing grain is expanding exports. [David Hull (202) 786-1840]

market has exhibited characteristic price weakness and a large stock build-up. Soybean oil use is price inelastic, so sharp price declines, as in 1985/86, do little to stimulate use. Prices (f.o.b. Decatur) averaged 17.6 cents a pound in April and will average about 17.7 cents in May, compared with 33.6 and 32.5 cents a pound in April and May of 1984/85.

With the loan rate providing a price floor and the soybean oil market so weak, soybean meal prices have maintained crush. The year's domestic soybean meal use as of April trails last year's rate by about 3 percent and could decline further. The higher price will probably reduce feeding rates, which were near record last year. Soybean meal exports are exhibiting their seasonal decline as South American products enter the market. Weakening demand will squeeze crush margins, resulting in reduced crushings.

Over the next few months, the soybean market will be driven by 1986 U.S. production prospects, which depend increasingly on the weather. With prices fairly stable, the most salient factor indicating market strength could be CCC loan redemptions. Should demand weaken, loan redemptions would falter and CCC acquisitions would rise.

World production of oilseeds in 1986/87 is expected to exceed 1985/86. U.S. output will decline, but other countries, especially Brazil and India, could recover from last year's poor outturn. Although planting for Southern Hemisphere crops will commence several months from now, Brazil's economic program contains incentives to expand agricultural land use, and could lead to large gains in soybean planting in the Northern States. If the major foreign exporting nations produce more, U.S. export prospects will decline.

The outlook for expansion of pork and poultry production implies some growth in world soybean meal utilization. A significant influence in world trade patterns is the Soviet Union, which is using greater amounts of protein in its feed rations. Increased meal use by the USSR is built into USDA assumptions of trade for the coming year.

The global vegetable oil market will remain oversupplied with palm oil even if the growth in Malaysia's output slows, because stocks are far above

year-earlier levels. Large oilseed supplies and high vegetable oil stocks create weak prospects for U.S. soybean oil exports. Importers' willingness to use U.S. credit programs will have a major impact on sales. The 1985/86 shipments of soybean oil are not even half the current forecast. [Roger Hoskin (202) 786-1841 and Jan Lipson (202) 786-1691]

Cotton

Although imports of cotton textiles remain high, and cotton prices have risen relative to polyester since the summer of 1984, U.S. mills are using more cotton this season than at any time since 1979/80. Factors include a shift in consumer preferences toward natural fibers, plus fashion trends and a perception that cotton will become less expensive when the new farm bill goes into effect. Mill use for 1985/86 is expected to total 6.3 million bales, and could rise to 6.8 million next season.

Futures prices for 1986-crop cotton were around 34 cents a pound in mid-June, which equals a mill-delivered price of about 40 cents. In contrast, current mill-delivered cotton prices are over 70 cents and polyester prices are around 63 cents. Lower oil prices will benefit manmade fibers, but not nearly enough to meet the increased competition from cotton.

Given a demonstrated consumer preference for cotton, competitive prices, and a fall in the value of the U.S. dollar, the outlook for U.S. cotton use in 1985/86 and beyond has brightened considerably. Even though textile imports will limit domestic mill use, a turnaround in U.S. textile exports is possible. This would boost domestic mill use because there is a one-to-one tradeoff between textile exports and mill use.

The decline in U.S. textile exports has not received the media attention given to the rise in imports, but the potential for increased exports (and domestic mill use of cotton) is suggested by the export decline in the 1980's. In 1979-80, the cotton equivalent of annual U.S. textile exports averaged about 1 million bales; in 1984-85, it averaged 435,000 bales.

World trade in raw cotton is down in 1985/86, primarily because importers have been deferring nonessential purchases until after the new U.S. farm bill takes effect with lower prices on August 1. World consumption, however, is projected to rise from 69.4 million bales in 1984 to 73.2 million this year.

a 5.5-percent increase. Foreign consumption will be up 5 percent, while U.S. consumption will rise an estimated 8 percent.

But, the growth in consumption and drop in production are insufficient to offset oversupply. World ending stocks for 1985/86, estimated at 47.1 million bales, are still excessive and will be 11 percent larger than beginning stocks. Foreign stocks will fall 750,000 bales, with all of the decline in importers' stocks. Exporters' stocks will rise 15 percent, with the United States accounting for virtually all of the increase.

Planting of 1986 cotton is underway in the Northern Hemisphere and progressing satisfactorily. Based on planting intentions, U.S. area will fall sharply. Foreign area is expected to remain about the same as in 1985.

World production is expected to fall about 4 percent to 75.2 million bales in 1986. Consumption is also projected at 75.2 million, a 3-percent increase from 1985/86. However, both the production decline and consumption growth are expected to be less than in 1985/86. China and the United States, major exporters, accounted for most of the consumption growth in 1985/86.

The United States will account for most of the world production drop; foreign production may decline slightly. Both importers and exporters are expected to increase consumption, but growth among importers will be more substantial, as they take advantage of continuing price declines.

Despite falling production and rising consumption, world ending stocks are expected to remain high, and both the world oversupply and strong export competition will continue. Trade will rise in 1986 as importers replace stocks and make purchases they previously deferred. Some additional importer stockpiling may also occur. But, exporters' supplies will still greatly exceed importers' demand.

In 1985/86 the United States' total cotton supply was 17.6 million bales (14.5 percent of the world total); this year, the expected U.S. supply is 20.4 million bales (16.5 percent of the projected world total). However, last season, the United States had virtually no cotton available at the world price; in 1986/87, the bulk of the U.S. cotton supply will be available at the world

price. Exports from the United States should respond strongly to this new competitive position, and world cotton users will benefit from this large increase in the amount of cotton available to the market. [Sam Evans (202) 786-1840 and Carolyn Whitton (202) 786-1691]

Tobacco

Lower domestic use and exports may cut U.S. tobacco disappearance 3 percent this season. Still, use will exceed 1985/86 marketings. So, stocks carried over to the new marketing year (beginning July 1 for flue-cured and October 1 for burley and other kinds) likely will decline about 6 percent from last year's 3.85 billion pounds.

Supplies are expected to decline because the crop and carryover stocks will probably be smaller. Because of smaller allotments and quotas, marketings will be about 15 percent below 1985's 1.46 billion pounds. With a smaller crop, reduced price supports for flue-cured (excluding rebates), and unchanged support for burley, auction prices are expected to be lower. Effective prices, though, may not change much from a year ago.

March planting intentions point to 6 percent less flue-cured acreage than last year. However, acreage may be lower than March intentions because a new quota was announced on April 25 that is lower than that announced under the old legislation. With the 1986 quota, about 675 million pounds can be sold. Production in 1986, added to 25 to 30 million pounds of 1985-crop tobacco that was not sold because of insufficient quota, may exceed available quota. So, 1986/87 flue-cured supplies could drop about 215 million pounds, or around 7 percent. With a smaller quota and lower support prices, loan receipts may decline.

Burley growers indicated they would plant 8 percent less acreage in 1986. However, a lower quota was announced on April 25 that voided the previous larger quota. About 466 million pounds of tobacco is likely to be marketed with the 1986 quota. New production, plus 50-55 million pounds of 1985-crop tobacco that could not be marketed without penalty, means marketings are expected to exceed the total permitted.

In the year ending June 30, Americans likely consumed 2 percent fewer cigarettes than a year earlier. Even with

higher exports, production for 1985/86 is below the 665 billion units produced last season. Production and domestic sales during second-half 1986 will again fall below last year, because of higher prices, smoking restrictions, and antismoking activities. Cigar, smoking tobacco, snuff, and chewing production are all down this season as well. [Verner N. Grise (202) 786-1840]

Fruit

The first forecast for the 1986 California almond crop is 250 million pounds (shelled basis), 46 percent below last year and 57 percent below 1984's record. Rain in major producing areas during the critical bloom period may make 1986 yields among the worst ever. Although most varieties and areas were affected, the Sacramento Valley was hit especially hard.

Almond acreage is increasing, however. The latest forecast for 1986 is 418,000 acres, compared with 409,243 in 1985.

Both domestic and export almond shipments have been strong during 1985/86. According to the Almond Board of California, 455 million pounds were shipped during the first 11 months (July 1985-May 1986), up 24 percent from a year earlier. Exports totaled 316 million pounds, an increase of 28 percent.

West Germany, the United States' leading customer, imported 49 percent more than last year, mainly because of low U.S. prices and a lower valued dollar. France and the United Kingdom, the other major importers in Western Europe, boosted their imports by 41 and 37 percent, respectively. Overall, shipments to Western Europe rose 39 percent and accounted for more than 53 percent of U.S. almond exports.

The Soviet Union, the largest customer after West Germany, continued to raise its purchases during the first 11 months of 1985/86, with a gain of 67 percent over a year before. The Soviet Union bought U.S. almonds instead of Turkish filberts, which were in short supply because of substantially reduced production during the last two seasons. The Soviet Union accounted for nearly 21 percent of total U.S. almond exports.

Shipments to Japan, the third largest buyer, increased 20 percent from a year earlier. Shipments to Western Europe, the Soviet Union, and Japan

40-Point Fall in Stocks-Use Ratio Raises Almond Prices 14 Cents

\$/kernel pound

accounted for over 87 percent of U.S. almond exports during the first 11 months of 1985/86.

Export prospects for 1986/87 are favorable, assuming the value of the dollar stays at current levels. Furthermore, Spain, the world's second leading producer, may suffer a crop shortfall from freezing temperatures April 12 and 13, and this could further boost U.S. almond shipments to Europe.

USDA recently announced that it will use generic certificates to pay for the Targeted Export Promotion Program (TEPP), which helps U.S. almond exports hurt by Egypt's and India's restrictive import policies and the EC's refund program. (Generic certificates give the holder title to redeem a certain amount of commodities from CCC stocks.) The TEPP focuses on increasing U.S. almond sales in Western Europe, Japan, and Korea. Promotion will be done jointly by USDA and the almond industry. USDA will reimburse firms up to 50 percent with generic certificates for approved promotion in eligible countries during 1986/87.

Domestic demand has also been strong; shipments totaled 140 million pounds during July 1985-May 1986, up 16 percent from a year earlier. With healthy demand, carryout stocks are expected to be much smaller than a year ago. The smaller upcoming crop, combined with reduced carryout, will spell smaller almond supplies in 1986/87. Consequently, prices received by growers are expected to be substantially higher

Exports of California Almonds

Destinations	1980/84 average	1984/85	1985/86 July 1 - May 31

during the coming season than the depressed 65 cents a pound reported for the 1985 crop. [Ben Huang (202) 786-1766]

Vegetables

U.S. vegetable growers are reducing 1986 acreage and hoping for improved second-half prices. Based on winter and spring-season estimates of fresh-market harvest area and processors' contract intentions, 1986 acreage could be down 4 percent from 1985. This is a response to low fresh-market prices during spring 1985 and winter 1986. Also, large stocks of processed vegetables remain from 1985/86's canned and frozen supply. For the second consecutive year, the value of vegetable exports was lower than imports. Total 1986 vegetable demand could continue to weaken unless the overall trade situation improves.

Winter and spring potato plantings in 1986 were lower than 1985's, because growers in California and Florida cut area in response to lower market prices. Fresh-market prices for storage potatoes hit new lows following the record 1985 fall crop. The continued inventory surplus is causing distributors to increase cullage and growers to reduce demand for seed potatoes. High yields increased 1986 winter potato production 6 percent to 2.8 million cwt, but average spring potato yields are expected to hold output to 19.8 million cwt, down 14 percent from 1985.

Total 1985 vegetable export value dropped 7 percent from 1984 to \$930 million, while vegetable imports rose 4 percent to \$1.385 billion. Fresh vegetable exports, including potatoes, fell 26 percent in 1985 to 529,827 metric tons, worth about \$218 million. Canada reduced demand about a quarter, and Asia by nearly half. Thus, Canada's share of U.S. fresh-vegetable exports

increased from 79 percent in 1984 to 82 percent in 1985. Fresh vegetable imports, which are about half the total value of U.S. vegetable imports, increased 9 percent. Mexico, the United States' biggest supplier, increased its exports to U.S. markets about 10 percent.

Cumulative 1986 shipments of fresh vegetables are about 7 percent greater than January-April 1985 because of increased imports from Mexico and good yields in Florida. The larger supplies have put farm prices below their season average. The seasonally adjusted index of grower prices for fresh-market vegetables averaged only 100 (1977=100) during first-quarter 1986, down from 122 a year earlier. Prices will likely rise in the second half as supplies from Mexico taper off and domestic growers reduce acreage. [John Love (202) 786-1767]

Sugar

World sugar production in 1986/87 is forecast at 100.5 million metric tons, raw value, up 4 percent from the 1985/86 estimate of 96.5 million. Cane sugar production is expected to climb 5.6 percent and beet sugar production 1.6 percent. Geographically, the largest increases are likely in the Caribbean and Asia, each up 10 percent.

Caribbean sugar production is forecast to increase because of larger output in Cuba. Cuban production is expected to increase 12.6 percent to 7.6 million tons, up from the weather-damaged 1985/86 crop.

In Asia, higher sugar production is forecast in India, Indonesia, and the People's Republic of China (PRC). India, the region's largest producer, is expected to boost output 14 percent to 8.7 million tons, because Government policies support expanded area. In Indonesia, increased harvested area and slightly higher cane yields may lift output 6 percent. In the PRC, cane

sugar production is expected to rise 7 percent to 4.7 million tons, while beet sugar production is forecast to increase 31 percent, following 1985/86's 20-percent drop due to bad weather.

World sugar consumption in 1985/86 is estimated at 98.0 million metric tons, raw value, reflecting growth of 1.2 million over last year's revised level. Use was greater than earlier expected in Canada, the United States, the PRC, and Japan, but less in the USSR and South Africa.

Prices for raw sugar in the United States (nearby No. 12 futures contract) averaged 20.67 cents a pound for the first 5 months of 1986. This is well below the market stabilization price (MSP) of 21.50 cents. The first-quarter average was 20.69 cents, up only 0.1 percent from the same period in 1985, but 8.0 percent higher than fourth-quarter 1985. Prices should rise slightly in the next few months because demand will increase seasonally, stocks are somewhat lower than a year ago, and deliveries are anticipated to be close to last year.

After falling 5 percent from 1984 to 1985, sugar deliveries in first-quarter 1986 were down 0.9 percent from a year earlier, totaling 1.76 million short tons, refined. Deliveries for industrial use fell 0.3 percent. Lower deliveries to the beverage industry more than offset increases of 5.7, 4.2, and 25.8 percent in deliveries to the confectionery products, dairy products, and multiple food use sectors, respectively. Sugar deliveries to nonindustrial users fell 1.8 percent; lower deliveries to wholesale grocers and brokers offset a 7.6-percent increase in deliveries to retail grocery stores.

U.S. sugar stocks at the end of first-quarter 1986 were estimated at 3.39 million tons, raw value, down 0.9 percent from a year earlier. Stocks were lower for beet processors, mainland cane processors, and refiners, but higher for the CCC and Hawaiian processors.

Another factor in declining stock levels was that first-quarter imports totaled only 580,638 tons, raw value, down 33 percent from a year earlier. Moreover, the decrease in stocks would be much larger if not for the big increase in sugar held by the CCC. If CCC stocks are not included, ending stocks for first-quarter 1986 are 3.17 million tons, a decrease of 7.2 percent from a year earlier. [David Harvey (202) 786-1769]

COMMODITY SPOTLIGHT

Malaysia's Palm Oil Production and Exports

Malaysian Palm Oil: Rising Competitor

Palm oil has emerged as a major competitor in world vegetable oil markets during the past decade. Malaysia is the main producer, and since its domestic use is negligible, most output is exported.

The climate and economy in Malaysia favor the cultivation of the high-yielding oil palms. The palm oil industry is well organized, drawing on more than 50 years of experience from large estate farms. Since the early 1960's, the Malaysian Government has also supported smallholder producers, and area planted to oil palms has increased rapidly as a result. During 1970-85, production increased at an annual average rate of 17 percent.

In the 1970's, Malaysia also encouraged refinery investment to increase employment. The campaign was successful; palm oil exports have changed from all crude oil in 1970 to almost exclusively refined oil today.

Used in the manufacture of shortening, margarine, frying fats, soaps, and detergents, palm oil is extracted from the flesh of the oil palm fruit. A tree usually produces 5-15 bunches of fruit a year, each bunch having about 800 to 1,000 fruit. The fruit is first processed into crude palm oil, then refined to remove impurities, bleached, and deodorized.

About half Malaysia's palm area was planted 10 years ago or less. The oil palm starts bearing fruit 30-36 months after the seedling is planted. Yields rise rapidly, peaking within 8 to 10 years, and then slowly decline. As the oil palms continue to grow in height, the harvesting cost increases. After about 30 years it becomes more profitable to remove old trees and replant the fields. Replanting also provides an opportunity to use new higher and earlier yielding varieties.

Two major technological events have raised palm oil production in Malaysia. In 1981, the Cameroon weevil was introduced as an alternative to expensive manually assisted pollination. The improved pollination resulted in more fruit and denser fruit bunches. Although precise data are not available,

Year	Production	Exports 1,000 tons	Share 1/ Percent
1970/71	431	402	4.9
1975/76	1,258	1,160	8.4
1980/81	2,540	2,174	19.4
1981/82	2,693	2,434	18.3
1982/83	3,351	2,654	18.6
1983/84	3,179	2,869	20.2
1984/85	3,322	2,821	17.4
1985/86	3,817	3,256	19.7
1986/87F	4,800	4,000	

1/ Malaysian palm oil exports as percent of world vegetable oil trade. F = forecast.

Palm Oil Cheaper Than Soybean

the weevil has probably increased yields.

Cloning — reproducing trees vegetatively — is the other breakthrough. Cloning may eventually increase yields by about 30 percent. About 5 to 10 percent of the plants are cloned every year, but low prices could discourage expansion.

Because oil palms bear fruit for decades, the crop is not responsive to short-run price movements; production decisions are based on long-run expectations of prices and profitability and the level of Government support.

Present prices give Malaysian palm oil an edge in world vegetable oil markets. It will likely continue to compete strongly with soybean oil and other vegetable oils during the rest of this century.

During 1985, Malaysia produced a record output of palm oil, continuing the long uptrend in production. Area, production, and exports will likely continue to increase substantially for the rest of the century.

The expected increase in Malaysian palm supplies will compete with U.S. soybean oil. Malaysia may export 4 million tons in 1985/86 and perhaps 6 to 8 million by 2000. Palm oil's low production costs make it a strong competitor for soybean oil, and Malaysia has the additional advantage of proximity to its export markets. India and Pakistan account for 22 percent of Malaysia's palm oil exports. Japan, Korea, and Bangladesh are also major customers.

Continued growth in Malaysian palm oil production will make the task of marketing more difficult and may exert downward pressure on world vegetable oil prices. Although exporting firms and the Government are aware of the need to market increasing supplies, there is no integrated marketing promotion plan. Marketing development efforts to date have included official missions and trade teams, tours for foreign dignitaries, technical assistance, market identification, overseas offices, end-use research, and trade shows. World Agriculture and Trade

FORECAST LOWERED FOR U.S. FARM EXPORTS

U.S. agricultural exports for fiscal 1986 are now forecast at \$27.5 billion, down 2 percent from the February forecast and 12 percent below 1985. While lower prices for major commodities account for some of the year-to-year decline, expected drops in grain and cotton volumes are more important. Reduced Soviet purchases and strong price competition from other exporters will mean a smaller U.S. share of world trade and lower export volume. Volume during 1986 is forecast at 115.5 million tons, about 10 million below 1985.

Farm imports in 1986 are expected to gain marginally from a year earlier, to a record \$20 billion. The resulting agricultural trade surplus is placed at \$7.5 billion, down from \$11.4 billion during 1985 and the smallest surplus since 1973.

U.S. agricultural exports have been lower thus far in 1986, even though the value of the U.S. dollar (as measured by the Federal Reserve Board's trade-weighted basket of currencies) has fallen about 25 percent on foreign exchange markets since its February 1985 peak. U.S. farm exports will not benefit as much as this decline implies, partly because the dollar has strengthened against the currencies of some major agricultural competitors, such as Canada, Australia, and Argentina.

Also, there is a considerable lag between changes in the dollar and their impact on exports or imports.

Another reason U.S. exports have fallen in 1986 is that Soviet grain imports are about one-half of 1985's record. U.S. agricultural exports to the USSR are expected to drop more than \$1 billion, accounting for about one-quarter of the drop in U.S. export value this year. (This forecast has not been adjusted to reflect possible effects of the Chernobyl accident, however.)

Importers Delay Purchases

Importers this year have delayed purchases from the United States and other countries in anticipation of lower prices in the summer and fall when new U.S. loan rate and marketing loan provisions become effective.

How much importers respond to lower U.S. prices depends on the importance of price in purchasing decisions. The loss of U.S. price competitiveness was one factor in the U.S. export volume decline between 1980 and 1986, recently forecast at 40 million tons. A simple comparison between U.S. and foreign prices and exports demonstrates such an effect in the long run. But, examining U.S. export prospects this year by customer shows some other problems that U.S. exports face in the near term.

One method of comparing prices is to compare export unit values (EUV's). A commodity's export unit value is found by dividing its export value by its export volume. The benefit of comparing EUV's rather than selected f.o.b. prices is that the EUV is in a sense an average price weighted by the volume of products sold. A possible drawback in comparing U.S. and foreign EUV's is that quality differences or other particular characteristics of commodities are not considered.

U.S. Commanded Premium Price

The accompanying table compares U.S. and foreign EUV's for a basket of major U.S. agricultural exports — grains, soybeans, soybean meal, and cotton — between 1971 and 1984. (Foreign exports in this basket are weighted by each commodity's relative importance to U.S. exports, since the United States is the focus of this analysis.)

For whatever reasons (e.g., quality, ease of transport), the United States

U.S. Exports Became More Price Competitive Between 1960 & 1980

*Ratio of U.S. to foreign export unit values for soybeans, soybean meal, and cotton.

appears to have commanded a premium for the basket of goods during most of this period, albeit a declining premium. From 1971 to 1980, the ratio of U.S. to foreign EUV's fell 2 percent annually. At the same time, U.S. export volume for these commodities rose 11.8 percent annually.

However, from 1980 to 1984, the U.S.-foreign EUV ratio rose 2.6 percent annually and U.S. export volume fell at a 2.7-percent compounded annual rate. During the two periods, 1971-80 and 1980-84, foreign exporters' respective annual increases in volume were 8.7 and 1.7 percent.

The last extended episode of a rising U.S.-foreign EUV ratio was in the first half of the 1970's. The average ratio during 1970-74 was 6.6 percent higher than during 1965-69. But, U.S. export volume rose then and rose faster than did foreign volume, illustrating that price has not always been the sole determinant of exports. The United States was able to command a premium in this earlier period because of a lack of alternative suppliers, but substantial increases in foreign production have occurred since then.

1980-84 Trends

Continue in 1985 & 1986

In 1985, exports fell and the United States lost market share in major commodities. Since most of fiscal 1986 will occur before the appearance of lower

Export Unit Values and Volume*

Period	U.S. EUV/Foreign exporter EUV	Average annual change	Foreign export volume

U.S. loan rates, 1986 exports will suffer similarly. Also, U.S. exports this year have faced — in addition to still-high prices and importers' delays — heightened efforts by foreign competitors to make sales before U.S. and world prices drop.

Coarse grains and cotton illustrate this effect. Fiscal 1986 U.S. coarse grain exports are currently forecast to have the lowest value and volume since 1975. In such Asian markets as Japan, South Korea, and Taiwan, U.S. coarse grains have faced effective competition from large exportable supplies of Thai, Chinese, and Argentine corn; a recovery in South African production and exports; and feed wheat from several suppliers.

Similarly, the estimate for 1986 cotton exports now stands at \$700 million and 500,000 tons, down \$1.3 billion and 800,000 tons from 1985. Cotton exports by Australia, China, and Pakistan continue to displace U.S. shipments to such key Asian markets as Japan and South Korea. However, the situation is expected to improve as the new marketing loan provisions allow the United States to regain its price competitiveness after August 1.

Soybeans, Livestock Gaining

In contrast, the United States' market share and volume of soybeans and soybean meal exports are increasing significantly, largely in response to drought-reduced production in Brazil and large USSR purchases. Oilseed and products exports are forecast at \$6.6 billion, \$200 million above 1985. However, a glut of vegetable oils, especially palm, will result in sharply lower U.S. soybean oil exports (see the Commodity Spotlight on palm oil in the Crop Highlights section).

The export forecast for the livestock, dairy, and poultry sector stands at \$4.5 billion, \$400 million above last year. The improved livestock outlook stems largely from various provisions of the 1985 farm bill, including increased butter and cheese shipments and sales of beef and dairy animals under the Dairy Termination Program.

Regional Outlook Shows Gains and Losses

Examining 1986 U.S. export prospects from the perspective of customers rather than commodities shows problems that lower U.S. prices will not help in the short run.

Wheat, corn, soybean, and cotton exchange rates and export unit values are now included in the U.S. Agricultural Trade tables at the back of this issue.

North Africa is the only region expected to increase its imports of U.S. agricultural products in 1986. Lower petroleum prices hurt North African countries directly through smaller receipts or indirectly through lower worker remittances. But, food consumption subsidies and aid programs will allow the region to maintain consumption and imports this year.

A significant increase in U.S. wheat exports to North Africa is already underway under the aegis of the Export Enhancement Program (EEP). Exports of U.S. wheat and products in the first half of 1986 have already exceeded the amount exported to North Africa in all of 1985.

The outlook for U.S. exports to Japan is less positive. Lower prices and smaller U.S. market shares in coarse grains and cotton are expected to cut U.S. agricultural exports to Japan by about \$600 million. Despite increased profit margins for Japanese livestock producers, grain and oilseed demand there has been stimulated only slightly.

Export prospects to Western Europe are also weaker, even with European economic performance likely to be the strongest since the end of the 1970's. U.S. agricultural exports to Western Europe are expected to fall about 3 percent, to \$7 billion. Nevertheless, prospects are up for soybeans, soybean meal, and horticultural products.

While lower prices account for some of the decline in sales to Europe, the expansion of the European Community from 10 to 12 members is also a factor (see article following). The accession of Portugal and Spain to the EC has meant the application of variable import levies in these two countries since March 1, and has led Portugal to establish controls on domestic vegetable oil consumption. These actions have displaced U.S. sales. Prospects for U.S. coarse grain exports to Western Europe are also dimmer in 1986 because of increases in European wheat gluten production.

The outlook for Latin America has deteriorated since the February forecast, and U.S. farm product exports there are now estimated significantly below 1985. Export value may fall \$400 million, about 8 percent, in 1986.

The first half of 1985 was itself 30 percent lower than a year earlier.

Exports to Central America and the Caribbean are expected to fall only slightly in 1986. The outlook is better this year for corn and soybean exports to Brazil, in the wake of reduced production there. However, wheat exports to Brazil have already fallen substantially because of much improved production there.

During 1984 and 1985, large production shortfalls in Sub-Saharan Africa required record and near-record U.S. agricultural exports to the region. In 1986, the value of U.S. exports will probably drop more than a third because of improved food production, lower prices, and efforts by some countries in the region to restrict imports.

U.S. agricultural exports to other regions will also generally be lower, although exports to Eastern Europe and the Middle East will be about the same as last season. Increased domestic production will be the major factor reducing exports to Canada and South Asia. Efforts to restrict all imports and conserve foreign exchange will reduce exports to Southeast Asia and China. Competition and lower prices will be additional factors reducing exports to Southeast Asia, as well as to Other East Asia.

The level of U.S. agricultural exports depends not only on U.S. prices vis-a-vis competing exporters but also on the desire and ability of customers to import. This means the degree of importers' response to lower U.S. prices hinges in part on factors other than just agricultural prices. [Stephen MacDonald (202) 786-1621]

EC ENLARGEMENT & U.S.-EC TRADE CONFLICT

Spain and Portugal became members of the EC on January 1, 1986. Their transition to the EC's Common Agricultural Policy (CAP) began on March 1 and will last for 7 to 10 years for many major commodities. U.S. agricultural exports to the two countries are expected to decline because of adoption of CAP provisions.

As members of the General Agreement on Tariffs and Trade (GATT), the United States and EC have trade commitments to each other. U.S. producers want to be compensated for expected export losses from the EC's enlargement. Consequently, the President has imposed quotas on selected imports from the EC, although the quotas are not yet restrictive, and temporarily withdrawn U.S. promises not to raise tariffs on other EC imports.

Even though U.S. exports to the EC-10¹ fell 22 percent in 1985, to \$6.9 billion, accession of Spain and Portugal makes the new EC-12 the world's largest market for U.S. agricultural exports. Spain and Portugal alone purchased \$1.9 billion, 5 percent of all U.S. farm exports, in fiscal 1984. Grains and oilseeds have been the primary U.S. agricultural exports to the two nations, followed by tobacco, cotton, tallow, hides, and nuts.²

Estimates are that \$1 billion in U.S. agricultural exports could be affected by the new transition-period policies, although the amount of trade actually lost will probably be less. For example, a 1-percent increase in duties on a specific product could affect total exports valued at \$100 million, yet the export loss from the increased duty could be anywhere from negligible to total.

U.S. complaints with EC enlargement center on three major provisions of Spain and Portugal's transition to EC policies:

- Spain's imposition of a variable levy on U.S. grain imports,

¹Belgium, France, Italy, Luxembourg, the Netherlands, West Germany, Denmark, Ireland, the United Kingdom, and Greece make up the EC-10.

²For further details on the EC enlargement provisions for grains and oilseeds, see the *Western Europe Situation and Outlook Report*, RS-86-4, issued in May 1986. Copies are available for \$3.25 including handling from the U.S. Government Printing Office, Washington, D.C., 20402, or by calling the GPO order desk at (202) 783-3238.

Imports from the EC That Are Limited by New U.S. Quotas

Chocolate
Candy, NSPF
Apple or pear juices
Beer, ale, porter, and stout
White wine, value above \$4 per gallon

¹Imports in 1986 are allowed to grow 20 percent, except for white wine, which can grow 40 percent. NSPF = not specifically provided for in the tariff schedule.

- requirements that 15.5 percent of Portuguese grain import needs be filled by EC suppliers, and
- vegetable oil sales limits in Portugal that may hurt U.S. soybean exports.

Variable Levies Five Times The Earlier Duties

Prior to accession, Spain's duty on imported grain was limited under GATT to 20 percent, and the actual rate charged was generally lower. With accession, variable import levies and variable export subsidies took effect in Spain on March 1. Although they will be implemented gradually over 7 years, their impact will be to protect Spanish producers, as they do other EC producers, from competing with cheaper grain available on world markets. Spain imported corn at an accelerated rate prior to March 1 to avoid the variable levy, so total 1986 imports will not fall, even though little has been imported since March 1.

The variable levy, an import tax that increases as world prices fall relative to prices in the importing country, was more than five times the GATT-bound rate in May. More than one-fourth of current U.S. farm exports to Spain by value will probably be subject to variable levies once the transition is complete.

In Portugal, variable levies will also be introduced on some grain imports, ultimately affecting perhaps half of U.S. shipments to Portugal by value. But, since there was no earlier agreement in effect under the GATT to limit Portugal's import duties, the United States cannot get compensation for these levies even though they will reduce U.S. exports.

EC Market Share Rising in Portugal

The transition agreement calls for 15.5 percent of Portuguese grain imports to be filled by EC suppliers each year until 1990 — 15 percent from the EC-10 and 0.5 percent from Spain. If this

quota is not met in any one year, the difference is to be made up in the following year. Additionally, with a 5-ECU-per-ton³ preference on imports by the private sector and subsidies to offset the variable levy system, EC supplies are expected to make significant inroads into Portuguese grain markets.

Controls Put on Oilseed Imports

Oilseed prices in both countries have been increased over the last several years, in preparation for the EC's enlargement. These price hikes have already boosted production, although from relatively low levels compared with utilization.

Now, in addition, Portuguese imports of oilseeds will be controlled by means of limits on the amount of vegetable oil that can be sold domestically during the transition period. For 1986/87, 50,000 tons of soybean oil can be sold in Portugal. That is equivalent to soybean imports of 285,000 tons. Above this level, importers must make a deposit which is refundable only upon proof that the oil produced has been re-exported. Portugal currently re-exports about two-thirds of its soybean oil production.

Spain will also limit domestic sales of vegetable oils from imported oilseeds until December 31, 1990, to protect the market for domestic olive oil. But the marketing limitation on oilseeds in Spain has been in effect for some time, and it cannot be challenged as part of the EC enlargement negotiations.

For the U.S. oilseeds industry, the fear is that accepting any limitations on oilseeds trade with EC members may be the first step in the erosion of EC markets. The United States has challenged the Portuguese limits on domestic sales of oils.

U.S. Takes Trade Actions

On March 31, the President announced a set of possible trade actions aimed at retaliating for the potential trade losses from all the preceding policy changes. A July 1 deadline was set for EC agreement to compensate the United States for the losses. The compensation sought by U.S. negotiators includes an easing of other EC restrictions on some commodities, especially those most affected by enlargement.

³One European Currency Unit is worth about \$1 at current exchange rates.

Imports from the EC on Which Duties Are Temporarily Suspended

Hams & shoulders weighing less than 31 pounds
Blue-mold cheese
Edam & Gouda cheeses
Other cheeses & substitutes valued at more than 25 cents/pound.
Endive, including witloof chicory
Carrots in airtight containers
Olives in brine or otherwise preserved
White wine, less than \$4/gallon
Brandy, NSPF, greater than \$13/gallon
Cordials, liqueurs, containers less than 1 gallon
Hops
Gin in containers less than 1 gallon

NSPF = not specifically provided for in the tariff schedule.

After hearings and informal discussions, the announced actions — initially nonrestrictive — were undertaken on May 15. Quotas took effect on May 19 and temporary suspension of GATT-bound tariff concessions was to occur 30 days after notification of GATT parties.

A wide range of imports from Europe — including white wine, beer, fruit juice, and candy — are covered by the U.S. quotas. Pork, cheeses, vegetables, olives, white wine, liqueurs, gin, brandy, and hops are covered by suspension of previously accepted limits on tariffs.

The EC says that the restrictions accompanying enlargement will not cause U.S. exports to fall during 1986. The United States concurs. Thus, the initial U.S. action on quotas is also designed to have no immediate impact. U.S. quotas were first set at 120 percent of 1985 imports, except for white wine valued at more than \$4 per gallon, for which quotas were set at 140 percent of 1985 levels. The United States Trade Representative has discretion to increase the quotas if they become restrictive.

As for the temporary suspension of U.S. promises not to raise tariffs, the United States can reinstate the promises if the EC provides "adequate compensation for the imposition of variable levies on imports of corn and sorghum into Spain, or if it is determined that other circumstances so warrant." The Trade Representative also has discretionary authority in this matter. There is a provision in the original announcement to increase duties to levels that will affect trade if no compensation agreement is reached by July 1.

U.S. Exports to the EC Targeted for Possible Retaliation

Horse meat
Offals (beef)
Honey
Fresh foliage
Dried fruit
Sunflower seed
Tallow
Grapefruit juice
Pineapple juice
Orange juice
Canned corn
Beer
Wine
Soy meal
Corn gluten feed
Almonds
Wheat
Rice

EC Counters That

U.S. Industrial Exports Gain

The EC immediately responded to the March 31 announcement of U.S. retaliation with a list of products for counter-retaliation and a promise to mirror every U.S. action. In the event that the United States increases tariff levels on July 1, the EC has targeted soybean meal, corn gluten feed, almonds, wheat, and rice for some response, depending on the U.S. action taken.

The Community's response to the May 15 U.S. announcement was to set up a surveillance system for selected EC imports from the United States. This means that the EC will monitor imports of specific products monthly to be prepared for any retaliation that it may decide upon.

In announcing the surveillance system, the EC indicated that so long as U.S. actions do not actually limit EC exports to the United States, there will be no real limitation on U.S. exports to the EC.

Article 24, section 6, of GATT provides for negotiation and compensation when a customs union such as the EC is enlarged and there is a resulting increase in tariff rates, subsidies, or quotas. The treaty directs that due account be taken of compensation already afforded by reducing other duties.

EC and U.S. officials held preliminary discussions of compensation under Article 24:6 in Geneva on May 2, followed

by further discussions at the end of May and in June. The EC claims that Spain and Portugal's joining the EC will reduce tariffs on U.S. industrial-product exports more than any losses that result for agriculture.

The United States has replied that while tariffs on industrial goods are decreased for U.S. suppliers to Spain and Portugal, they will be decreased even more for competing EC suppliers — so that there will be no net benefit to the United States to offset losses in agricultural trade. Furthermore, U.S. negotiators have rejected the principle of offsetting across sectors.

While some reductions in U.S. farm exports to Spain and Portugal were avoided by judicious Spanish stockpiling in early 1986, the threat to U.S. grain exports is clear. The threat to oilseeds depends more on overall change in the CAP than on the accession of Spain and Portugal. However, acceptance of marketing limitations now might set a precedent for further restrictions later. [Mark D. Newman (202) 786-1719]

Upcoming Releases from the Agricultural Statistics Board

Transportation

FRESH PRODUCE SHIPPING OUTLOOK

Transportation should be readily available for this summer's fresh fruit and vegetables. Trucks will remain in good supply and account for more than 86 percent of all overland fruit/vegetable shipments.

Although the refrigerated trailer fleet will stay large, fewer refrigerated trailers were delivered through March 1986 than during the same months of 1985. Deliveries of new vehicles for the year are now estimated at 17,700 units, 25 percent below 1984's record but still above the 1980-85 average.

Much of the new equipment consists of 48-foot vans, which offer 6 to 11 percent more carrying capacity than 40-foot vans. Operating costs for large vans are not appreciably higher, so substantial gains in efficiency are available from the new trailers.

The market share of trailers-on-flat-cars (TOFC) appears to have leveled off at about 6 percent. Between 1981 and 1982, their share more than doubled. At that time, some observers suggested that TOFC's might substantially reduce trucks' dominant position, but this has not proven true.

Many railroads have reported that TOFC traffic is no more than marginally profitable. A recent study by the

consulting firm of Temple Barker & Sloane, Inc., indicates that TOFC traffic using 40-foot vans (for which most flat cars are configured) is competitive with the new 48-foot trucks for distances greater than 1,175 miles. But, truckers pulling two 28-foot trailers retain an advantage over TOFC for distances up to 1,700 miles. All this suggests that TOFC's market share of produce distribution will not change much in the foreseeable future.

A number of new TOFC car designs are now being evaluated, but radically different cars are unlikely to enter the rail fleet in significant numbers for the remainder of this decade.

Trucks' Flexibility and Size Give Them Competitive Edge

Trucks offer produce marketers several advantages over competing modes. Much of the edge is related to the highly perishable nature of many produce items. Advantages include the following:

Rapid Transit. Truckers guarantee delivery from Salinas, California, to New York City within 80 hours. Some TOFC trains now offer 72-hour service between California and Chicago. But, unloading a trailer from its flat car and transporting it to the final destination requires additional time and expense. Conventional rail shipments often require 10 or more days for a transcontinental trip. Trucks' rapid service results in increased shelf life for highly perishable items such as lettuce.

Trucks can also be placed in the field at harvest and begin their trip immediately after loading. While TOFC trailers can be filled in the field, they still must be loaded onto flat cars, and unloaded at destination. The first trailer loaded onto a flat car does not move until the last trailer is loaded and the train leaves, often a matter of several hours.

For each type of produce, there is an optimum temperature and relative humidity. Produce truckers can easily and frequently check the condition of the load and make temperature and humidity corrections. As a result, produce shipped by truck is more likely to arrive at destination in good condition.

Scheduling and rescheduling. — Since the growing rate of fresh fruits and vegetables depends chiefly on weather, harvest times are relatively unpredictable. A grower may have as little as 24 hours' notice that a given field will

Trucks Haul Lion's Share of U.S. Produce

be ready for harvest. Packers, who arrange for most transportation, have even less notice.

Scheduling for trucks requires only a call from a single packer to a single truck driver, so arrangements can be made rapidly. Communications are more complex for the other modes.

The time of arrival at destination is equally important. Produce arriving at a terminal market after the market closes (most are closed by 9:00 a.m.) will remain unsold until the following day. Truckers have considerable ability to vary both their departure and arrival times, while railroads must conform to complex, system-wide schedules. In the case of transcontinental shipments, more than one railroad is involved and precise scheduling among railroads has proven very difficult to achieve. It should be noted that the "just-in-time" concept of inventory control, recently popularized by Japanese auto manufacturers, has existed in the produce marketing industry for at least 20 years.

Unlike train cars, trucks can also be rerouted without delay after departure. A driver normally calls either the packer or the buyer (whoever controls the shipment) about twice daily. At these times the truck can be directed to

a different destination if necessary. Although railroads pioneered a similar service, known as diversion-in-transit, they have less ability to divert.

For a railroad to divert a car, the car must be in a rail yard. The process involves stopping the through train, removing the car to be diverted, and waiting for it to be placed in a train bound for the new destination. Thus, diversion-in-transit for railroads is costly, time consuming, and subject to error. In contrast, the rerouted trucker needs only drive to the next appropriate intersection and turn onto the new route.

Size of shipment. — The refrigerated rail cars now in common use are of two sizes, 83-ton and 66.5-ton capacity. Most markets are unable to absorb an entire carload of certain produce items. For example, a capacity load of strawberries for the smaller size car would amount to 133,000 1-pint boxes. A similar load of radishes would amount to 332,000 6-ounce bags. In some instances, more than one kind of produce can be shipped in a rail car or trailer, but opportunities for mixed loads are limited.

Trucks, with an average capacity of 22.5 tons, offer a more convenient marketing unit for produce, especially because the microclimate inside the shipping vehicle must be adapted to the particular fruit being shipped. The ideal climate for one item may induce premature spoilage in another. For example, the proper amount of ethylene supplied to an orange turns the skin orange, but an excess will rapidly spoil the fruit.

California Leads Both TOFC & Truck Shipments

Two States. California and Florida, accounted for nearly 55 percent of all fresh fruit and vegetable shipments in 1985. Of these two, California was by far the larger, with 41 percent of all shipments. The third largest produce State, Washington, accounted for slightly more than 6 percent. California and Florida ranked first and second in volume shipped by truck and TOFC. California was the largest conventional rail shipper, but Idaho — fifth ranked in total shipments — was second in conventional rail shipments. Idaho's rail volume, one-third of all rail shipments, approached that of California (38 percent).

Each State's distribution pattern results from the kind of produce shipped and the distance from usual markets.

About 67 percent of California's conventional rail shipments are of so-called hardware items: carrots, oranges, and potatoes. These vegetables spoil less easily than most others. Idaho's conventional rail shipments consist chiefly of onions and potatoes. Both States are located long distances from Eastern population centers. Thus, California and Idaho shippers of hardware items find regular rail service to distant markets sufficient for their needs.

Moreover, locally grown supplies of carrots, onions, and potatoes are available at least seasonally in most Eastern markets. To remain competitive with local items, Western hardware growers must use relatively low-cost rail service.

Thus, conventional rail shipments are associated with long distances and hardware produce. TOFC tends to offer more rapid transit times. In 1985 nearly half of all produce shipped by TOFC consisted of three items: iceberg lettuce (27 percent), oranges (15 percent), and celery (6 percent). It seems likely that TOFC competes chiefly with conventional rail service.

Distance, Perishability Set Shares at Terminals

Market share among the modes at terminals is chiefly a function of how far away the various produce items were grown. Most of New York-Newark's rail receipts are potatoes grown in Idaho. TOFC receipts consist chiefly of iceberg lettuce and oranges from California. Maine is the source of most potatoes arriving by truck.

TOFC is competitive with trucks in Chicago in delivering California-grown lettuce and oranges, which together account for most of the TOFC deliveries to Chicago. Chicago draws heavily on the upper Midwest for potatoes, which arrive by truck.

In Baltimore-Washington, TOFC arrivals compete with truck deliveries from Florida. Production in Florida is highly seasonal. Baltimore-Washington receipts are shown in the adjacent table.

St. Louis is located too near Western producing areas for TOFC's to be competitive, and has access to vegetable-producing areas in nearby States. Rail receipts in St. Louis consist chiefly of hardware items grown in Idaho and the upper Midwest.

Los Angeles, located close to California producing areas, relies nearly exclusively on trucks. Its rail receipts consist chiefly of Oregon-grown potatoes.

Truck Costs, Rates Often Show Discrepancy

Produce rates are highly seasonal, conforming to large fluctuations in volume shipped. During the first 5 months of 1986, rates from California have averaged 3-4 percent above the same period last year. Average rates from Florida and Washington for grapefruit and apples have been unchanged.

Costs of operating produce trucks (as reported by USDA's Office of Transportation) declined sharply for both owner-operators and fleet operators during January-April 1986, chiefly from lower fuel costs. Between December and April, both owner-operators and fleet operators saw 25-percent reductions in per-mile fuel costs, to 20.3 and 19.9 cents, respectively.

Despite the break in operating costs, rates for highly perishable items are expected to rise as the summer vegetable harvest goes into full swing. Rates for hardware items are expected to remain nearly constant at least until fall.

Truck rates are not closely related to costs in the short run. During 1985, lettuce rates (California to New York) averaged 106.9 cents per mile, while truck costs averaged 116.1 and 117.0 for owner-operators and fleet operators, respectively. From this it might seem

that truckers regularly haul produce for rates that do not cover full costs. But, peak rates and peak volumes shipped occur together.

At peak harvest last year, trucks hauled 21.3 million cwt of lettuce at rates of about 136 cents per mile, with per-mile costs of less than 117 cents. So, on a total revenue and total cost basis, truckers appear to have nearly broken even on produce hauls in 1985.

It should also be noted that produce truckers back-haul manufactured goods toward produce-growing areas. Revenues from these hauls at times subsidize produce shipments. During peak harvest times, however, revenues from produce may subsidize manufacturers' shipments. [T.Q. Hutchinson (202) 786-1864]

1985 data.

Prosperity in Parts: Changes in the Broiler Industry

Since World War II, broilers have grown more important in the total meat industry. Fryers used to be just the young roosters from the egg-laying flocks. But, during the 1950's, new technology, improvements in breeding, and disease control made it possible to raise birds year-round in large confinement houses. This set the stage for the growth of integrated poultry operations that combine hatching, feed production, bird grow-out, and slaughter.

Integrators maintain ownership of the birds, determine the feed, and market the birds. The integrators, which began mainly as hatcheries or feed companies, typically do not own the grow-out portion of operations, but contract with farmers to house and raise the birds.

Integrators Adapt Quickly

This system means that changes in demand from retail chain buyers or food service purchasers can be incorporated directly by the integrator, who controls the whole process and the final product. The integrators have also continually adopted new technology and lowered their costs of production. They have been able to expand production for most of the last 25 years, while still keeping broilers competitively priced. The farm price of broilers was near 29 cents per pound in 1952. In 1985, the price was slightly over 30 cents.

The combination of a competitively priced product and expanded production has resulted in increased consumption. Consumption in whole bird ready-to-cook equivalents was 23 pounds per person in 1960, but by 1985 it had increased to 55 pounds.

Broiler Returns Often Negative...

... Despite Climbing Consumption

The gains in per capita consumption mean that the number of broilers raised sets a new record almost every year. In 1985, 4.5 billion birds were produced, up from 4.3 billion in 1984. By comparison, only 1.8 billion broilers were raised in 1960.

Slaughter Weights Up

In addition, the birds are now slaughtered at heavier weights. In 1960, the average federally inspected slaughter weight of young chickens was 3.36 pounds; in 1985, it was 4.19 pounds. Part of the reason for the heavier birds is producers' desire to get more high-valued breast meat. Also, the bigger birds cost less per pound of meat to debone.

Broiler firms are highly competitive. The estimated net

Price for Breast Meat Twice That for Whole Birds by 1985

Over Half of All Broilers Now Cut Up or Further Processed

returns to producers selling whole birds at wholesale have been negative in 10 of the last 19 years. Because of the tight profit margin, firms have aggressively adopted new technology to cut costs. Also, they have shifted production from commodity unbranded birds to higher valued branded birds, parts, and further-processed products.

The competition has forced the less efficient firms out of business. Firms accounting for 90 percent of production numbered 45 in 1985, down from 68 in 1977 and 104 in 1972. In 1985, nine firms with 67 plants accounted for over half of the liveweight broilers slaughtered under Federal inspection. In addition, all of the top eight firms did further processing of broilers. The number of firms is expected to continue to decline.

Chicken Nuggets Turn To Gold

Further processing of young chickens is on the increase. Hot dog and sausage-type products were added to many poultry lines in recent years. Now, trade shows are highlighting machinery for further processing poultry into nuggets and patties — products that are chopped and formed.

The chopped and formed technology is appealing because low-valued cuts can be converted to higher priced products. The new products have characteristics much closer to fresh meat cuts. They are viewed as more healthful than the ground, sausage-type products and are in demand. Marketed by brand name in frozen food cases, they are designed for quick meals.

Producer-processors have a strong market for chicken breast meat and would like to find higher value uses for the remainder of the chicken. The "sausage kitchen" items, such as chicken dogs, use the chicken parts that are best mechanically deboned — backs and necks. A similar end product is needed for legs and wings.

A comparison of wholesale prices for whole broilers and for parts gives an idea of the relative appeal of new uses for the parts. In 1960, prices per pound for breasts with ribs were about one-and-a-half times the price of whole broilers. But, by 1985, breast prices were almost twice the whole bird price. The upward trend in breast prices reflects the addition of various breast meat entrees in restaurants, especially fast-food restaurants.

Chicken leg prices were about 25 percent higher than whole birds in 1960, but by 1985 they stood 8 percent below whole birds. Prices for chicken wings, although up in the mid-1970's, have been below whole birds during most of the period. Thus, there is a price incentive for processors to find additional uses for the nonbreast part of the broiler.

18 Percent of Total Slaughter Is Now Further Processed

The poundage of further-processed young chickens has been increasing in both absolute terms and as a proportion of total slaughter. The biggest jump as a proportion of total slaughter has been in the last 5 years. In 1980, the pounds used in further processing equaled 11 percent of total young chicken slaughtered. By 1985, further-processed poundage was up to 18 percent of total slaughter.

In addition to further processing, more young chickens are being cut up. In the early 1960's, cut-up young chicken equaled about 20 percent of slaughter. By 1985, the share was 54 percent.

Another trend that will likely continue is the addition of turkey or red-meat processing operations by broiler firms. Those firms with a reputation for product innovation and consistent quality may horizontally integrate at the wholesale level to present a full line of further-processed products with a recognized name. With a full line, salesmen have more of an opportunity to talk to buyers and sales may be made in truck loads, cutting delivery costs. Thus, firms may move toward being food processors more than broiler producers. [Allen Baker (202) 786-1830]

New Soviet Farm Policy Could Trim Grain Imports

The Soviet Union recently announced policy and organizational changes aimed at improving efficiency and production in agriculture. A major goal is to decrease reliance on imports. Agricultural imports have grown rapidly in recent years, as the Soviets have tried to maintain growth in per capita consumption despite poor domestic production. If the recent policy changes do spur agricultural growth, U.S. agricultural exports to the Soviet Union — which have more than quadrupled since 1972 — could be threatened.

Long-term prospects for U.S.-USSR agricultural trade depend upon a number of factors, including U.S. prices in world markets and Soviet hard-currency earnings. The most important factor, however, is Soviet domestic production.

Growth Slow for a Decade

Soviet agricultural output has grown only a little more than 1 percent annually over the last decade, less than half the rate of the preceding 10 years. Western specialists argue that centralized decisionmaking has hurt both Soviet farm production and efficiency, especially in recent years.

In the Soviet system, farms are ordered to produce certain crops, using specified inputs allocated by the state, with final output largely sold to the state at set prices. The commonly identified drawbacks of this approach are that farmers have little financial incentive to increase production, introduce new cropping techniques, or plant new crops.

Soviets Missed Goals of Last Three 5-Year Plans

Percent of plan fulfillment

Farmers also have few reasons to economize on input use, or develop and apply new technology. Moreover, since the state purchases most output at set prices, marketing and quality are of little concern to the farmer.

In addition, the different agricultural subsectors — farm input manufacturing, agricultural production, and food processing — lack incentives to cooperate, because each is planned and evaluated separately.

For example, industries producing inputs, such as machinery and chemicals, have no direct incentive to provide productive and reliable inputs to the farms. Should the farms find the inputs unsatisfactory, there is no direct, effective signaling mechanism for them to inform manufacturers. Farms cannot refuse to purchase the inputs, find other suppliers, or purchase competing products. The fact that central authorities evaluate performance largely on quantity, rather than quality, worsens the situation further.

Infrastructure Weak

Similar coordination and cooperation problems exist between the processing sector and the farms. Lack of roads, vehicles, and storage complicates this stage. Recent estimates suggest that if the Soviets could lower waste and losses from harvesting, processing, and transportation to reasonable amounts, consumption could increase up to 20 percent. The Soviet leadership feels that the infrastructure difficulties are related to unbalanced investment in the agro-industrial sector. Poor coordination of investment levels and lack of cooperation between the input, farming, and processing sectors cause inefficiency.

Soviet leaders have identified many of the problems affecting agriculture and believe that adjustments to the centralized system can improve output significantly. Recently announced policy and organizational changes reflect their belief. These changes fall in line with an earlier program, announced in May 1982, that formed organizations at

Value of Russian Farm Output
Unchanged Since 1983

Billion rubles

local, republic, and national levels to bring together participants from all three major parts of the agro-industrial sector. These organizations had little official power, but were designed to improve communication among participants.

Earlier Program Ineffective

By mid-1985 it was obvious that the new organizations were not working. They had little power to force collective decisions on unwilling members, and their decisions were often heavily influenced by powerful special interest groups that dominated other members.

One difficulty was that members of a group could be asked to transfer a product or service within the organization, rather than sell it to the state as part of their procurement plans. The idea was that these intra-organizational transfers would increase output of products which that organization or its dominant members saw as particularly important.

Some members refused to cooperate because in many cases the price they received for the transfer was less than the state procurement price. Also, because of the transfer, the member could lose plan fulfillment bonuses.

Meanwhile, those members receiving the transfers could prosper, in terms of either plan fulfillment or increased profits from cheaper inputs, with the boost coming at the expense of the transferring member. In the end, necessary infrastructure continued to be underfunded, farm inputs remained of low quality, there was still little incentive to increase output or conserve on input use, and significant waste and losses continued at all stages.

New Super-Ministry Created

In late 1985, following 3 years of stagnation, the Soviets combined most of the agro-industrial sector's formerly independent ministries into one, called "Gosagroprom" (State Agro-Industrial Committee). Gosagroprom has the role of a super-ministry, with full powers for planning

output, input, and investment allocations among its members — something the original voluntary organizations did not have.

The goal of Gosagroprom is to prevent individual agro-industrial participants from maximizing their own production at the expense of the overall sector's performance. The chairman of Gosagroprom is responsible for the entire sector's performance, and thus has incentive to coerce cooperation among members.

Although Gosagroprom represents a significant centralization, its authority does not extend to input or processing industries. It does include the organization responsible for transferring inputs from manufacturer to farms, but this organization can influence only the timeliness of deliveries, not technical designs or quality. Gosagroprom's relationship to the food processing sector is similar. Gosagroprom contains only the organizations that transfer farm produce to the processing industries. Thus, it can only minimize losses during harvest and shipment, not during processing.

Gosagroprom has the unenviable task of improving agro-industrial performance by centralized administrative fiat. Although its decisions, because of better information, are supposed to be better than those made under the previous system, it still faces many of the old problems. It may prompt bureaucrats to improve their performance, and provide farms with inputs and services on time. However, it gives little direct incentive to the farms to increase output, use inputs more efficiently, or introduce new techniques. Nevertheless, some marginal improvement in performance could come from better coordination among Gosagroprom members.

Prodnaolog Reintroduced

Besides creating Gosagroprom, the Soviets have reintroduced a policy sometimes referred to as "prodnaolog" (food tax), which attempts to stimulate production at the farm level. Prodnaolog was originally initiated by Lenin in 1921 to boost output.

At that time, the policy required farmers to turn 5 to 17 percent of their net production over to the state. The rest could be disposed of as the farms desired — to the state, a cooperative, or in private markets. Thus, farmers had greater reason to increase production, and during 1922-23 over 75 percent of the value of retail trade was handled by private sources. Currently, private sources account for only 2.6 percent of retail trade.

Under prodnaolog, agricultural production grew rapidly. Despite the progress, though, the policy was effectively abolished by 1929, because the Government came to see that it could not control the relative development of agriculture and industry under a market environment. In the official view, agriculture's development was occurring at the expense of industry.

The more recent pronouncements on prodnaolog are not very specific. Farms will be allowed to market above-plan production through any of three outlets: the state, the consumer cooperative, or a collective farm market. The

freedom to dispose of above-plan output could be a powerful incentive, since prices in the cooperative are generally higher than state procurement prices, and collective prices are higher yet.

However, the Soviets are not likely to revise plan targets, which are probably unreachable. Under the original prodnalog, the state claimed 5-17 percent of actual production. Since the current prodnalog allows farms to control only output that is above plan targets, the out-of-reach goals may render prodnalog incentives relatively useless.

For important commodities such as grain and meat, output over the past 5 years has averaged 74 and 94 percent of target, respectively. Plan targets remain unrealistically high for 1986-90. Still, if farms do have significant production potential that has been untapped because of poor incentives, prodnalog could lift output substantially.

Even if production increases dramatically, though, bottlenecks will probably still appear in transportation, marketing, and processing. Furthermore, input industries may not be able to deliver the materials needed to lift production. Other potential constraints on increased output include declining soil fertility and highly variable weather.

At best, prodnalog could bring moderate improvement in production and deliveries of farm commodities. Farms already at or close to plan targets will have greater incentive to produce above plan and increase profitability. Consumers should benefit from more available food in cooperatives and collective farm markets. They will probably pay higher prices, however, than in the state retail system. The state will benefit from having more food marketed outside its retail network, allowing for increased consumption without steeper retail price subsidies.

Clearly, Gosagroprom and prodnalog could improve the Soviet agricultural system and help production and efficiency. But, at best they could bring moderate gains in production, in the range of a few percent. A few years of exceptional weather might raise production more than these policy and organizational changes.

Many Unknowns Affect Grain Import Outlook

Weather and other factors aside, even a moderate increase in domestic grain production could reduce Soviet grain import needs substantially. Long-term Soviet import growth will also be determined in large part by consumption targets.

Steady, substantial progress toward consumption targets is important for the Soviet leadership, even if actual attainment is not. In recent years, poor domestic production has forced the Soviets to import to improve per capita consumption or, in the case of meat, to simply maintain it. Since most Soviet grain imports are used in meat production, future meat consumption goals should heavily influence grain imports.

Grain import needs also depend greatly on domestic production growth. Moderate improvements over domestic output of the last 5 years with increased domestic consumption would still result in substantial grain imports by 1990, but less than the 42 million metric tons (mmt) averaged recently. If Soviet grain production reaches 220

Soviet Grain Import Needs in 1990

Scenarios	Per capita meat consumption	
	65 kg	70 kg
Million metric tons		
I. Grain production remains at 178 million metric tons (the 1981-1985 average) through 1990.	57	76
II. From 178 million metric tons, grain production grows 3 percent annually through 1990, because of recent policy changes and a general growth trend.	28	47
III. Growth the same as scenario II, but base year estimates assumed to be 190 million metric tons.	15	34

Grain import needs represent the difference between total grain needs and total domestic production. Total grain needs are based on the historical relationship between grain production and meat production. Estimated 1990 population figures are used to estimate total meat production necessary to provide the per capita consumption levels used, accounting for waste and 1 million metric tons of meat imports.

Imports Make Up Shortfalls in Soviet Grain Output

mmt by 1990, and per capita meat consumption remains at 65 kilograms, grain import needs will drop by nearly 65 percent. However, imports could remain high even with better domestic output, if the state decides to raise per capita meat consumption to 70 kilograms by 1990.

Soviets Typically Are Big Grain Buyers

Since the early 1980's, the Soviet Union has consistently ranked as the world's largest importer of wheat and coarse grains — accounting for a whopping 17 percent of global trade in those crops. Although the Soviets imported large amounts of grain during the middle 1970's, they began steady imports of even bigger quantities in 1979, when their own production fell 25 percent.

For various reasons, USSR grain outturn has fallen well short of domestic targets; in the early 1980's, actual or estimated production was annually about 40-50 million tons below unreachable state goals. Imports, which fluctuate inversely with domestic production, peaked in 1984/85 at over 55 million tons, an unprecedented 27 percent of global sales.

Despite its failure to reach state targets, the Soviet Union typically ranks as one of the largest wheat producers in the world. However, the Soviets chronically have quality problems. Also, they feed much of this lower quality wheat to livestock — over 40 million tons annually the last 6 years, compared with 10 million in the United States. These factors have led the USSR to import large amounts of wheat for food consumption.

Wheat imports since 1979/80 have averaged about 19 million tons a year, accounting for about 20 percent of total world wheat trade. No other country — including China, which in earlier years purchased large amounts — comes close to that level. The Soviets also export over 1 million tons of wheat annually, most going to Eastern Europe.

In a typical year, the Soviets purchase 12 to 18 million tons of coarse grains, mainly corn from the United States, China, and Argentina, and barley from the EC, Canada, and Australia. They are surpassed only by Japan, which relies more than any other country on imported grain. Soviet purchases have jumped sharply in 2 recent years — to 26 million tons in 1981/82 and 27 million in 1984/85 — when production shortfalls were especially large.

Since 1979/80, Soviet purchases have comprised 19 percent of world coarse grain trade, ranging from 27 percent in 1984/85 to 12 percent in 1982/83. Poor grain outturn and limited nonstrategic grain reserves have necessitated big imports to maintain or increase meat and dairy production.

Continued depressed oil and gas prices, coupled with potential declines in energy sales to Western Europe,

Clearly, predicting Soviet grain import needs is hazardous given the large number of variables. The scenarios in the accompanying table, while not attempting to predict import needs, do supply some useful boundaries.

The recent changes in agricultural policy and organization could improve domestic production. Nonetheless, radical

will cause some financial concern to Soviet planners. Nonetheless, USSR grain imports from the world — and from the United States — will probably remain high for at least the next several years. [James Cole (202) 786-1691]

USSR Accounts for Most of Variation in World Grain Trade

improvement is unlikely because many other negative factors remain. Grain import needs could remain substantial even if domestic production strengthens. And, annual weather variations could cause large increases in imports if domestic stocks do not rise. Which exporting nations capture large shares of these needs will be determined by relative prices, world supply, and Soviet hard currency supplies. [Robert B. Koopman (202) 786-1710]

1/ Retail costs are based on indexes of retail prices for domestically produced farm foods from the CPI-U published monthly by the Bureau of Labor Statistics. The farm value is the payment to farmers for quantity of farm product equivalent to retail unit, less allowance for byproduct. Farm values are based on prices at first point of sale and may include marketing charges such as grading and packing for some commodities. The farm-retail spread, the difference between the retail price and the farm value, represents charges for assembling, processing, transporting, and distributing these foods. 2/ Estimated weighted average price of retail cuts from pork and yield grade 3 beef carcasses. Retail cut prices from BLS. 3/ Value of carcass quantity equivalent to 1 lb. of retail cuts; beef adjusted for value of fat and bone byproducts. 4/ Market value to producer for quantity of live animal equivalent to 1 lb. of retail cuts minus value of byproducts. 5/ Represents charges for retailing and other marketing services such as fabricating, wholesaling, and in-city transportation. 6/ Represents charges made for livestock marketing, processing, and transportation to city where consumed.

Note: Annual historical data on farm-retail price spreads may be found in Food Consumption, Prices and Expenditures, Statistical Bulletin 736, ERS, USDA.

Information contacts: Denis Dunham (202) 786-1870; Ron Gustafson (202) 786-1830.

E = Estimated. P = Projected. F = Forecast. 1/ Excludes intra-EC trade. 2/ Where stocks data not available (excluding USSR), consumption includes stock changes. 3/ Stocks data are based on differing marketing years and do not represent levels at a given date. Data not available for all countries; includes estimated change in USSR grain stocks but not absolute level. 4/ Calendar year data. 1980 data correspond with 1979/80, etc.

Real 2/	101	100	100	100	98	97	97*	97*	95*	93*	93*

1/ Nominal values are percentage changes in currency units per dollar, weighted by proportion of agricultural exports from the United States. An increase indicates that the dollar has appreciated. 2/ Real values are computed in the same way as the nominal series, adjusted for CPI changes in the countries involved.

*Preliminary; assumes the same rate of CPI increase/decrease as the previous six months.

Farm Income Database Available

If your business or research requires detailed farm income information, this Economic Research Service database is for you. The 4-disk set provides farm income statistics at the United States level for 1910-1984 and State and regional levels for 1949-84. The series covers net farm income, cash receipts by components, production expenses, capital expenditures, off-farm income, and related data.

Technical Specifications : 5 1/4 " DS/DD; MS-DOS
and PC-DOS Compatible;
360 kilobytes

Cost : *Farm Income Database*---\$50.00 for 4-disk set

Mail the following order form
and check or money order to:

ERS Publications
USDA, Room 228
1301 New York Ave., N.W.
Washington, D.C. 20005-4788

Enclosed is my check or money order for \$ _____ for _____ set(s)
of the Farm Income Database (ND 86001) (Make checks payable to ERS/Data)

Check these new, reduced subscription rates now offered on a user fee, cost-recovery basis from USDA's Economic Research Service.

AGRICULTURAL OUTLOOK.

11 issues annually averaging 52 pages. Subscribe from ERS for \$26 domestic; \$32.50 foreign. USDA's official outlet for farm income and food price forecasts. Data and discussion of issues ranging from international trade to prospects for commodity supply and demand, food marketing, agricultural policies, and other major issues affecting agriculture and the economy.

FARMLINE.

11 issues annually averaging 20 pages. Subscribe from ERS for \$14 domestic; \$17.50 foreign. Farm economic information in an easily read style, reinforced with charts and statistics for those without time to review all the technical reports from ERS. Reports on all economic topics important to those involved in agriculture, with the focus on the causes and implications.

NATIONAL FOOD REVIEW.

Quarterly averaging 40 pages. Subscribe from ERS for \$9.00 domestic; \$11.25 foreign. The latest developments in food prices, product safety, nutrition programs, consumption patterns, marketing, and processing technology for those who manage, monitor, or depend on the Nation's farm system.

HOW TO ORDER. Check the box for each publication or insert the number of extra subscriptions you wish to order. Write one check or money order to cover total charges. You will receive a copy of the most current issue, and a letter acknowledging your subscription. *Do not send cash. No credit cards. Sorry, no refunds.* Foreign customers note: Only checks drawn on U.S. banks, cashier's checks, or international money orders accepted.

Today and Tomorrow

... A USDA Video Documentary

Analysis of current events, coupled with a well-reasoned forecast of the future, has become one of the most important information tools for American agriculture.

Production, marketing, and public policy decisions are all based, in large part, on understanding today and planning for tomorrow.

At the Department of Agriculture, this type of information and analysis is called "outlook." The video production "Today and Tomorrow" provides an overview of USDA's Outlook program from its beginning in the 1920's, under the leadership of noted agricultural economist Dr. Henry C. Taylor, to the current sophisticated, rigorous, and comprehensive program of research and analysis.

USDA correspondent Dave Carter talks with government and private professionals who develop and use USDA outlook analysis. The video defines "outlook," and takes a brief look at each of the eight groups that contribute to the USDA Outlook effort.

To order a cassette copy of "Today and Tomorrow" (running time, 23:08), please fill out and return the coupon.

(For information call (202)786-1494)

Return to: Dave Carter, USDA, Rm. 228-E
1301 N.Y. Ave., N.W.
